

ABSTRACT

A powdered medicine multi-dose administering device
in which a hole (5c) is formed in the bottom surface of a
medicine storage chamber (5a) capable of storing a
powdered medicine of an amount of many times of
administering operation, the hole (5c) being located at a
position where a pump unit can be communicated with the
exterior via a pipe (2g, 2d). At the administering
position, the powdered medicine in a medicine container
unit (5b) is injected out of the device together with the
air through the pipe, while the hole is kept away from
being brought into contact with opening means (2f).
